Cadence — one-page stage cue card

One laptop · one browser · 15 minutes. All included results are simulated; zero real receiver captures are included.

Clock	Owner	Clicks and one thing to say
0:00	You	**Guided case / The idea:** “Short and long ping pauses carry 0 and 1.” Show `HI` → 16 bits.
1:30	You	**Runs:** 610 simulated, 0 captures; point to CSV import (sample / own files) and source labels.
2:15	You	**Signal:** two runs, gap timeline, distribution, measurements.
3:00	You	**Guided case / Detective:** defaults: 50 ms, 0.95/1.05 s, Case A. Compare blue/orange; choose **A hidden message**.
4:45	You → Harsh	Click **Continue: Guardian**. “We saw a clue; Harsh will test the decision and its cost.”
5:00	Harsh	**Guardian:** compare Same conditions, Fixed limit, Clean-only baseline. Say caught **and** false alarms together.
6:45	Harsh	Show red per-window decisions.
7:20	Harsh	Move pacing slider: message recovery falls, ordinary-ping delay rises. Model only.
8:05	Harsh	**Detectors:** three main choices, result tiles, verdict per window. Deeper controls: **Advanced options**.
9:10	Harsh	**Stress matrix:** read **How to read the grid**; optionally switch Metric to false-positive rate (dark is bad).
9:45	Harsh → Aarush	**Guided case / Locked note.** “Aarush will show what encryption changes.”
10:00	Aarush	**Locked note:** click **Lock this note**; `HI` → 46 bytes → 368 bits → ~6 min; show correct unlock and **Try a wrong key**.
11:55	Aarush	**Decode:** ideal message versus prepared noisy run; sent/decoded bit strip.
12:35	Aarush	**Guide:** search `jitter`; explain it in one sentence.
12:55	Aarush	**Guided case / Case closed:** sender → detective → guardian → encrypted receiver.
13:20	Aarush	**Evidence:** 610 simulated, 0 real captures, next receiver-side experiment, export buttons.
14:35	Aarush	Architecture and final claim. Leave Evidence visible.

Recovery: Start · Guardian · Locked note · Evidence.

If late: show each owned tab for a few seconds, then preserve the handoff. Say the limitation before closing: “This is a working analysis and teaching tool with simulated evidence; real-network validation still needs lab captures.”
